PLANT GEL is an excellent growing medium for plants due to its water absorbing ability. PLANT GEL can be used alone or with soil. Over 90% of the water and plant food are directly available to the plant's root system. No other component used in growing mixes allows this much absorption by plants. For example, clay soils retain a great amount of water, but less than 50% of the water is released to the root systems. In addition, PLANT GEL, being a gelatin, allows for excellent aeration.

Another advantage to using PLANT GEL is that the vitamins and minerals contained in the PLANT FOOD is time-released to the root systems, thereby continually providing these essential elements to your plants over a long period of time.

PLANT GEL is a 100% Non-Toxic, biodegradable, and odorless super absorbent polymer that absorbs up to 300 times its weight in water, and has a lifespan of approximately 5 years.

DIRECTIONS FOR WATERING PLANT GEL :

When the PLANT GEL settles approximately 1" to 1½" from its original level, it's time to add some water.

1. Mix *Schultz Plant Food Plus* with *Distilled* water (**Use Distilled water only**). For the proper amount to mix, follow the directions on the *Schultz* bottle.
2. Add water until PLANT GEL reaches just below the original level. If all the water is not absorbed after 3 hours, pour out excess water. (*Note: If you do not drain excess water, a faint odor may develop. If this occurs, simply rinse PLANT GEL in a strainer with fresh tap water. Let dry 1-2 hours and replace as previously directed.*)

For healthier, vibrant plants, gently mist leaves approximately every 1 to 2 weeks with fresh tap water (Optional, but recommended).
